ABSTRACT

E-banking, also known as online banking or virtual banking or internet banking is a system that enables banking transactions like transfer of funds, payment of loans and EMIs, deposit, and withdrawal of cash virtually with the help of the internet. E-banking in India is still in the early stages of growth and development. Competition and changes in technology have changed the face of the banking sector. The purpose of the study is to emphasize the concept of e-banking and introduce some new functionalities or methods that can further improve the e-banking services and infrastructure.

The present study has been undertaken to describe the present status of e-banking in India and examine the challenges & opportunities of e-banking. The main reason behind bringing innovation in current banking system was to provide customer with better services with help of technology and in this race of technology development internet served as the foundation stone for innovation banking.

The existing system of e-banking is pretty much evolved. However, the use of electronic banking service has its problems as well. The most frequently faced problems in internet banking are slow transaction speed, ease of access and security. Many customers are hindered by lack of computer skills, they need to be educated on basic skills required to conduct online banking or these services should be provided in such a way that all these functionalities can be easily understood by user. According to the RBI in its Annual Report 2020-21, stated that the payment systems recorded a robust growth of 26.2% in terms of volume on top of the expansion of 44.2% in the previous year. So, considering such large-scale usage of e-banking, the security becomes an important issue to be reviewed. Banks should implement the necessary tools against various types of attacks to ensure secure communication between the system and the services provided to clients. The younger generation is beginning to see the convenience and benefits of e-banking. In the years to come, e-banking will not only be an acceptable mode of banking but will be preferred mode of banking in India. And therefore, it is necessary to focus on improving these services.
