1.0 Introduction

1.1 Purpose of this document

The purpose of this document is to document the technical design, component details and Database design. This will also capture the scope, assumptions, risk, dependencies of this project.

1.2 Project overview

E-banking, also known as online banking or virtual banking or internet banking is a system that enables transactions like transfer of funds, deposit, and withdrawal of cash. The main purpose of this project is anybody can create a virtual bank account by sitting at home and access their transactions in a easy and flexible manner.

2.0 Solution Summary

2.1 Scope

The scope of the system is explained through its modules as follows

2.1.1. Admin Module:

Admin can Login into the site with his credentials and he can create the new accounts for the users, he can update the existing account and he can withdraw ,deposit,transfer operations for the account Holders. He can view all the transactions of the users which are present in the database.

2.1.2. User Module:

Initially the user needs to register with his details .Upon successful registration user will be provided with unique account number and credentials to login in to his account and then he can manage all his transactions.

2.2 Assumptions

- Admin should be able to login with his login credentials and he can add new accounts for the users and provide unique account number for the user.
- Admin should be able to see all the accounts and all the transactions present in the database.
- Admin should be able to Update the customer details, transfer ,withdraw and deposit transactions for the user.
- Admin should be able to charge the fine to the customer if the account balance is less than minimum amount.
- Users should able to register with the necessary information and should be able to login with their credentials.
- User should be able to create new beneficiaries and able to do transactions with the beneficiaries.
- User should be able to view all the transactions present in the database.

2.3 Dependencies

- Admin should open the account for the user when he gets request from the user.
- Admin should able update the account details based on the request of the user.
- Admin should able to do transactions transfer , withdraw and deposit for the Account holders

2.4 Risks

N/A

3.0 Schematic Diagram

A schematic, or schematic diagram, is a representation of the elements of a system using abstract, graphic symbols rather than realistic pictures. It gives an overview of overall system.

4.0 System Design

4.1 Proposed design

Internet banking is the system that allows customers to access general financial information transactions through a secure bank-created website. Nowadays, all banks provide internet banking because of its advantages.

It makes you accessing your bank account and carrying out financial transactions through the internet on your smartphone, tablet or computer. It's quick, usually free and allows you to do tasks, such as paying bills and transferring money, without having to visit or call your bank.

Architecture Level:

ADMIN LEVEL:

1. Admin Logs In
2. After Successful login
3. Operations can be performed such as Opening a new Account, Update the customer withdraw, deposit, transfer money for the Users. Admin can view all the customers, accounts and transactions, and can file the charges to the users if the balance is less than the minimum amount .

USER LEVEL:

1. User can either login or register
2. Upon successful login you can perform functionalities such as checking customer details, adding new beneficiary ,transferring ng money to the beneficiary account.

FUNCTIONALITIES IN THE USER PAGE:

1. Open Account:
Admin on clicking the "Add Account" or Open Account should be able to add new account. First Admin should be able to select the Customer then select the account type and enter minimum amount required to open the Account.
2. View All Customers: Ability of the system to allow the admin to view all the Customers
3. View All Accounts: Ability of the system to allow the admin to view all the accounts
4. Withdraw: Ability of the system to allow Admin to withdraw money for the user.
5. Deposit: Ability of the system to allow Admin to Deposit money for the user.
6. Transfer: Ability of the system to allow Admin to Transfer money to the user.

7. Balance Enquiry: Ability of the system to allow user to check the balance ammount in his account.
8. Update Customers: Ability of the system to allow user to update the profile details dynamically.
9. Bank Charges: Ability of the system should collect bank charges from the Users.

FUNCTIONALITIES IN THE USER PAGE:

1. User Home Page:

After successful login of user the user will be able to check the profile details of the .In that he can check the Account details and account balance.

2. Beneficiary:

The user will be able to check all the deneficiary details and able to add the new beneficiary details .

3. Transfer to Beneficiary:

When the user clicks on "Transfer to Beneficiary" then he needs to select the beneficiary and need to fill the fields such as Transfer Amount. If amount entered is more than available amount, transferring will be rejected and user will be notified to enter valid amount.

4. Transaction History: When the admin clicks on the transaction history the user will be able see all the transaction data.
